Want to preserve the good atmosphere from first try? Limit how much you talk about it. Researchers in Canada found that the more people who analyzed a good experience, the faster these positive emotions diminished. The explanation turns an emotional experience into a cognitive experience, says Sarah Moore, Ph.D., a marketing professor at the Alberta School of Business, and it dampens the emotions attached to them. To preserve these enthusiastic feelings, it's better to relive them than explain them, whether it's through videos, photos or a return trip. Calling for external hard drive backup can ensure that photos of your son's first soccer game aren't lost in the cloud. Most drives will last 10 years or more, says New York Times technology columnist David Fogg. Automate the backup process so that it runs continuously, and note file extensions. JPEGs and MP3s will be fine. But less common files - 3D animations, genealogy and so on - may be unstopable in a few years, he says. If you have the option to export your files in standard formats, like PDF or TIFF, now is the time to do it. This content is created and maintained by a third party and imported to this page to help users provide their e-mail addresses. You may be able to find more information about this and similar content in piano.io Szabo prefers to use the G-word when describing itself. I'm fat, she says actually. The 46-year-old clothing designer, fashion editor and occasional supermodel, not to mention a NAAFA (National Fat Acceptance Association) media spokesperson, educates me, a normal-sized person, about what it's like to be, well, fat. I called her at her san diego home under the false impression that big women (those wearing a size 16-28) and super-sized women (size 28+) find it hard to find fashionable, sexy things to wear. Oh, no, she's monitoring. The clothes are out there - you just need to know where to find them. According to the NAAFA, in our obsessive society, about 38 million Americans are significantly heavier than average. And although the women smiling off the pages of Glamour and Harper's Bazaar wear small-sized six-sized sixes, the average American woman wears a more generous size 14. And yet, even with, pardon the pun, the excess of larger women, merchandise refuse to recognize the plus-size market as one dominant. According to Sandy, the forces that still see plus are growing as a special market and that's not true. Of course there's an old gift like Lane Bryant, and Liz Claiborne's Elizabeth line. But today's new economy has created a niche for private entrepreneurs, who fill the need by catering to a larger customer. Thanks to the Internet, vendors like Sandy are opening virtual stores, and, according to her, creating a real network in the women's size-making community to find great clothes. Designs by Sandy, which is simple its anniversary, full of tights Lycra looks great and capris, coordinating shirts and flattering rocking dresses. Sandy focuses on the use of vibrant colors, precious, emotional fabrics and silhouettes that flow easily based on the body. Today, it ships to customers in Australia, Japan, the UK, New Zealand and, of course, America. I never thought I could do it until the Internet, she admits. This hotel is located in the center of cell 35 08/09/2018 name: Apropithcus (Greek for African monkey). Pronounced AFF-roe-pith-ECK-us Habitat: Jungles of Africa Historical Era: Miocen Middle (17 million years ago) Size and weight: about five feet and 100 kg Diet: Fruits and seeds Unique characteristics: large size: A relatively long nonot with large teeth paleontologists are still trying to sort out the complicated relationships of the early African hominids of the Miocene era, who were some of the first real monkeys on the prehistoric primate evolution tree. Afropithcus, discovered in 1986 by the famous mother-son team of Mary and Richard Lycchi, attests to the ongoing confusion: this wood-dwelling monkey had some anatomical characteristics in common with the better-known proconsol, and also seems to be closely related to Sivapithecus (a type that rampticus is now assigned as a separate species). Unfortunately, apropathicus is not well indicative, fossil-wise, like the other hominids; We know from his scattered teeth that he feeds on hard fruit and seeds, and he seems to have walked like a monkey (about a metre) rather than a monkey (on two legs, at least some of the time). Name: Abelesaurus (Greek for Abel's lizard); Pronounced AY-bell-ih-SORE-us Habitat: Woodlands of South America Historical Period: Late Carton (85-80 million years) Size and weight: approximately 30 meters long and 2 tons Diet: Prominent properties in meat: big head with small teeth; Openings in the skull above Abel's lizard jaws (so called because it was discovered by Argentine paleontologist Roberto Abel) are known only by one skull. Although whole dinosaurs have been less restored, this lack of fossil evidence has forced palaeontologists to hazard some guesses about this South American dinosaur. As betts its theropod ryon, it is believed that Abelisaurus resembles a scale-down Tyrannosaurus rex, with fairly short arms and a two-legged ready, and only weighing about two tonnes, maximum. The only strange feature of Abyssaurus (at least, the one we know for sure) is a selection of large holes in her skull, called Pénaria, above the jaw. They likely evolved to relieve the sheer weight of this dinosaur's head, which might otherwise balance its entire body. By the way, Abyssaurus lent his name to an entire family of theropod dinosaurs, the Havlisaurus - which includes prominent meat eaters such as the armed Carnautross From Jungthulus. As far as we know, Abelsaurs were confined to the south island continent of Gondwana during the Cretace period, now equivalent to Africa, South America and Madagascar. As far as palaeontologists might say, Achillobator (the name, an Achilles warrior, refers to both the large size of this dinosaur and the large Achilles tendons it must have in his legs) was a raptor, and therefore in the same family as Deinonychus and Velociraptor. Name: Achillobator (Greek/Mongolian combination for Achilles warrior)Pronunciation: ah-KILL-oh-bate-oreHabitat: Plains of Central Asia Historical period: Late happened (95-85 million years ago)Size: about 20 feet long and 500 to 1,000 poundsDate: predatorYana properties: large size; Giant claws on your feet; Strange alignment of hips however, Achillobator seems to have some strange anatomical properties (mostly concerning the alignment of his thighs) that set him apart from her more famous cousins, which has led some experts to speculate that it may represent a whole new type of dinosaur. Another possibility is that Achillobator is a lynnain: that is, it was accidentally recovered from the remains of two unrelated genera dinosaurs that happened to be buried in the same place. Like other criterion-era raptors, Achillobator is often described as a coat sport of feathers, underscoring her close evolutionary relationship with modern birds. However, this is not based on any solid fossil evidence, but the presumed feathers of small theropod dinosaurs at some point during their life cycles. In any case, up to 20 feet long from head to tail and 500 to 1,000 pounds long, Achillobator was one of the largest raptors of the Mesozoic era, only raised in size by the truly giant Juthraptor (which lived halfway around the world, at the beginning of the North American Cretaceous) and makes a much smaller Velociraptor look like chicken by comparison. Comparison.
